Icsee bulb camera manual

One of the coolest things about living in the time we do is all the technology that we get to experience. I've heard it before "I was born in the wrong generation". Not me, this one is pretty cool in my opinion! So when it comes to home security, it's no exception...there are tons of new gadgets and tools coming out year after year. One that's come out recently, and one that I think is super interesting, are Lightbulb Security Cameras. While it isn't a brand new technology, it sits in the sweet spot for technological maturity. What I mean by that is you can now find multiple manufacturers, the prices are much lower than they were to start, and there has been a sufficient amount of time for each company to work out the bugs of their products. Installing a security camera light bulb is as easy as installing a standard one. Turn off power to the light or socket, unscrew the old bulb, screw in the security camera bulb, and set up the camera via wifi. Because this technology is now readily available and not too expensive, I think it's a great time to pick one up. Read on for a short but detailed guide on installing and setting up a lightbulb security camera. Updated 8/7/2019: I put together a quick YouTube video to walk you through this process step by step. You'll find a link to it at the bottom of the page. Hope this helps! What is a Lightbulb Security Camera? As you probably know, there are many different types of security cameras and hidden cameras. Lightbulb cameras are just another variation of a hidden/camouflaged camera. They are actually a combination of a real lightbulb with a security camera usually hidden in the base, between the power source and the bulb itself. While they aren't always super discrete, they usually blend in pretty well. At first glance, you probably won't be able to tell the difference between a lightbulb that's a security camera and one that's not. Security Camera bulbs draw power for the camera from a standard light bulb socket, meaning they will readily fit and work in pretty much any adequately sized socket. The only caveat there is that lightbulbs come in different sizes - the little tiny candelabra ones, for example, won't fit a standard sized light - so make sure you get a camera that will fit your socket. Most security camera light bulbs, probably all of them actually as far as I'm aware, will also use wifi to transmit the video they record. So last thing to check before installing one in place of an old bulb is to make sure you have a decent signal for the bulb to connect to. So that's a bit about what exactly these lightbulb security cams are, but as with many security camera styles, many different companies make these products. Looking at spec sheets the various offerings will all look pretty similar, but there are some pros and cons that you should really take into consideration before settling on one to use. Who makes the best security camera bulb? If you're wondering who makes the best camera of this type, or which one has the absolute best all-around features, price, size, reliability...well...unfortunately, I don't have one straight answer. Like many products, not just home security related ones, there are different benefits to one brand vs another. The camera with the absolute best resolution might be what you're looking for, but it also might cost 4 times as much and be unreliable compared to a simple, cheaper model. If you're looking for the same Camera I use, which is has a good amount of features (IR, control from your phone, 2 way talk), and is pretty easy to setup, you can find it right here: If you're still not sure what camera you are looking for, check out the Recommended Products page! Over on the Recommended Products page, I go into detail on which Lightbulb Security Camera is best, in my humble opinion, for most situations. I also dive in briefly to the pros and cons of a few different models and try to find something that will work for everyone. There are also reviews and comparisons for other types of home security equipment, so go check some of them out! How do I install a security camera lightbulb? Once you've decided on a bulb cam and it has arrived at your doorstep, it's time to start the install process. When I say installing these security cameras is easy, I mean it's literally as easy as installing a light bulb. How many readers does it take to install a lightbulb you ask? Well...probably one...maybe more...depends who you ask. First, make sure you have a bulb that's going to fit your socket and that there is a good wifi connection in the location. You can use your phone or laptop to test the signal strength before install. I mentioned checking these things before, but it's worth mentioning again as a crappy signal or a bulb being too big has frustration-creation potential. Okay, so you're set on those? Now we can get into the install itself. Make sure power is turned off to the socket or light/lamp that you'll be working on. The last thing you want is to get shocked while installing your new camera... trust me, it's not fun. Remove the old bulb if there is one. Make sure you let the bulb cool down if it's been turned on for any amount of time. Carefully turn the bulb counterclockwise (right to left) and be ready to catch it when it's entirely loose. I usually use two hands here to make sure I don't drop the bulb. Place the old bulb somewhere safe, the box from your new bulb should be a good fit to keep the old one from rolling off the table or counter and smashing on the floor. Now you can do the reverse of step 2. Carefully screw in your new lightbulb camera in a clockwise motion (left to right) until it is snugly seated in the socket. You don't want to turn it too tightly as this can damage the bulb or cause it to break in your hands. Turn the power back on and make sure the light works. Depending on your make and model you might see an led light flash indicating that the camera has power or wifi signal. Make sure the light bulb portion of the camera is working and then we can move onto the wifi setup process. How to set up a new security cam over wifi. Setting up a lightbulb security camera is very similar to setting up any other wifi or IP security camera. The exact specifics of your camera are going to depend on your manufacturer's instructions, so I recommend getting those out of the box for this step. If your camera didn't come with any instructions in the box, you can check online at the manufacturer's website or try googling around to find some info. For our purposes, I'll give you some general instructions that should help you get going in the right direction. Using your phone or another device with wifi connectivity, you'll need to connect to the security camera. Open up your wifi menu and scan for new devices to find the security camera bulb, and once you find it go ahead and click connect. If you can't find the device, try turning the power to the light off for 10-15 seconds and then turning it back on. On some models, this will reset the camera (on others the camera is always on so this might not do anything). If you're still having trouble connecting, consult your user manual or contact customer support for your bulb's maker. Once you've connected the device, you'll need to open a browser and go through the setup of your camera. Often times you'll be automatically directed to the manufacturer's website, other times you'll have to navigate there yourself. Setup an account if necessary so you can connect and register your new device. If there is an app available for your brand of camera, you can probably skip the website bit and head straight to your app store of choice. Once you've set up a new account and registered/added your device to your account, you should be ready to test it out and start using it right away. Testing out a Lightbulb Security Cam As with any new security camera, no matter what technology it uses, I always use a similar test to make sure things are working as they should. Have a friend or a family member step out in front of the camera and do their best cha cha slide, twist, or even dab on the camera...I don't judge. If you don't have someone to help you out, you can try putting a tablet or phone in front of the camera and play a video. This lets you confirm the motion recording capability of the camera and shows that you're not just getting a still image on your screen. That's it, if you're having trouble with your new setup, you can try going back through the install steps above or you can use the resources provided to you by the company you bought the camera from. Hey! Thanks for reading this article! Below is a link to the YouTube video I made walking you through this same process. Give it a look! Best of luck, and enjoy your new camera!!! 1 ICSee Introduction 2 Synopsis ICSee is a mobile terminal video surveillance software specially developed for some monitoring devices (Fish-eye light bulbs, fish-eye light rain, etc.). The manual will mainly introduce how to use ICSee. 3 Function IntroductionCan use mobile phones view real-time video through WIFI and GPRS Support fish-eye equipment mode switch Support LAN automatic search, quick-set configuration, serial number and QR code scanning, etc. to add device Support remote playback and download video Support device parameter configuration Support to capture and view the scene support for live video recording and viewing Support alarm function 4 1 About Login CONTENTS 2 Add Device Smart Camera 3 Live Video 4 5 About login —Two Ways to LoginYou can login with your account and password before you connect the device, if you are the first to use it , you have register firstly. Temporary Login You can connect to the device directly without registering an account . NOTE : This way do not support Alarm and Message function. 6 About login —Register userUser name is composed of 4-15 bit Chin-ese ,English , numbers and underline. Password contains 8-32 characters , and must include letters and numbers Use to get register code or get pas-sword when you forget it. 7 Add Device Add My CameraNOTE: Before you search the device ,switch -on your device firstly , then it will start the quick-set configuration Add My Camera Click "Add My Camera" . Set the WIFI search the device Set password Choose a name 8 Add Device Add Shared CameraYou can add the device use the serial number or shared or you can scan the device QR Code to add the device. 9 Add device in the same WLANYou can add the device which under the same WIFI. 10 Smart Camera Delete Device Device Mobile Storage SetLong-press this thumbnail , you can delete the device Device Then you can find the device you just added. Mobile Storage Here you can check the snapshot pictures and records. Set Logout Settings : change password and clear cache and G-Sensor function About 11 Live Video NOTE: This is fish-eye light rain Live Video interface. It is similar to general household monitoring equipment's monitoring screen. Settings Here is the audio, definition , screen scale switch(Fish-eye device do not support the Four-grid mode). Video Clips, full-screen. View : playback the video or view the snapshots detailed information please refer to "Live Video-Playback" Long press open the intercom : use the intercom function Snapshot : click it to snapshot 12 Live Video Click here you can open/close Fish-eye light bulb function settings. NOTE : This is Fish-eye light bulbs Live Video interface which is a little different from other device. Here you can choose Ceiling mode or Wall hanging mode Here you can choose display style Switch : Here you can turn on/off the bulbs or set time period. Here you can adjust brightness . Here you can select image : Auto Mode. Color. B/W 13 Long-press thumbnail to download videoLive Video-Playback Date Choose Click "View ",then appear the below page which you can playback or check the snapshot Long-press thumbnail to download video Record Type Time Line 14 Live Video—Settings Motion Alarm Basic Setting GeneralHere you can Open Alarm and set the alarm type/time and choose the message ring . Then you can get alarm information like next page shows Basic Setting You can turn on the light and flip the view or modify the device's name General Here is the device information. Storage Management Here you can set the storage settings. Pwd Management Here you can modify the password APP information and its general settings. Advanced Management You can set the record mode (If you choose regular recording , the recordings will do not have alarm video),resolution , fps,quality,video clip,prerecord,audio. 15 Smart Camera—Alarm/MessageAlarm: When you set the alarm correctly, alarm message pushed to your mobile immediately like this. NOTE : It is the same as the setting interface which you enter through the live video settings. Message : When motion happened , you can go to Device List Interface to check the message. 16 Thank You Hangzhou Jufeng Technology Co., Ltd. icsee light bulb camera manual. how to reset icsee bulb camera. how to install icsee bulb camera. how to set up icsee light bulb camera
